

# ATLAS: UNITING YOUR TEAMS

UNITE BUSINESS AND DEVELOPMENT TEAMS THROUGHOUT THE LIFECYCLE

## BUSINESS ANALYST AND CUSTOMER: TWO AUDIENCES, SAME RESULT

Business Analysts and customers must think as one. Both need a deep understanding of the expectations and needs that must be resolved – and the priorities that must be met – by the solution.

Gathering, defining, planning and tracking business requirements is easy with Atlas providing the easy-to-use interface and offering real-time delivery status across all Agile teams and tools.

When customers work directly with Business Analysts in a secure, real-time managed way, problems are resolved faster. Customer enhancement requests are linked to current or new requirements throughout the life of the asset, offering customers a much closer relationship with the organization.

## PRODUCT MANAGER AND BUSINESS ANALYST: READY TO PRESS GO?

Sharing and collecting feedback on possible application delivery scenarios and their implications is easier when Product Managers and Business Analysts can use Atlas's dynamic release planning to perform 'what if' scenarios on releases. They are enabled to react faster to shifting business priorities and adapt their plans between iterations, with or without the development teams.

## STAKEHOLDERS AND AGILE TEAMS: WHY MEET WHEN YOU CAN 'DO'?

For stakeholders and Agile teams, checking into delivery team plans to understand their progress, and individual project requirements will always beat holding meetings. For stakeholders with Atlas, viewing real-time project status, translated as business needs and expectations, is as easy as clicking a button.

Agile teams still describe their payload with stories and tasks and can now link to more detailed requirements, without leaving their tool or losing information. Product delivery times are shortened because concepts and ideas are linked to requirements; delivery plans keep all stakeholders in sync, business and delivery teams are brought closer together and miscommunication across teams is all but eliminated.

## THE PROJECT MANAGER AND AGILE TEAMS: PLANNING FOR SUCCESS

Agile teams looking to plan, or re-plan, projects using the popular Agile planning and tracking tools need access to real-time delivery status. The project planning feature in Atlas offers better requirements management, which means fewer software defects are introduced in the requirements phase. Now, with a single source of information across even the most complex development environments, project managers' delivery timescales are more accurate to predict and Agile teams don't waste time translating status and progress information into other formats.
